

# British Hoverflies: the genera

[L. Watson](#) and [M. J. Dallwitz](#)

## Conventional key

If you are serious about identification, you should use the [interactive key](#). It is far superior, with flexible choice of characters, character notes and illustrations, error tolerance, full taxon descriptions, and taxon illustrations.

- 1(0).
  - The humeri bare (often obscured by the appressed, deeply concave rear of the head) ... [2](#)
  - The humeri hairy, and readily visible behind the head (the head well forward, not concave behind)... [63](#)
- 2([1](#)).
  - The flies 2-5 mm long ... [3](#)
  - The flies 5-10 mm long... [7](#)
  - The flies 10-15 mm long... [32](#)
  - The flies 15-20 mm long... [62](#)
- 3([2](#)).
  - The eyes hairy ... [4](#)
  - The eyes bare... [5](#)
- 4([3](#)).
  - The face ground-coloured at least part yellow; the upper and lower outer marginal cross veins strongly stepped; antennae with their bases approximated; the larvae flattened; the larvae not green ... **Paragus**
  - The face entirely dark in ground colour; the upper and lower outer marginal cross veins slightly stepped; antennae with their bases well separated; the larvae scarcely flattened; the larvae green ... **Melanostoma**
- 5([3](#)).
  - The face ground-coloured at least part yellow; the thorax patterned; the larvae tapering anteriorly and posteriorly from the middle ... **Sphaerophoria**
  - The face entirely dark in ground colour; the thorax plain; the larvae broader posteriorly, tapered to the head... [6](#)
- 6([5](#)).
  - The front tibiae and/or tarsi dilated in males, broad and flattened in females; the metasternum entire, broad over its whole length ... **Platycheirus**
  - The front tibiae and/or tarsi simple; the metasternum reduced, the sclerotized part small with the central area diamond-shaped ... **Melanostoma**
- 7([2](#)).
  - The thorax with longitudinal stripes ... [8](#)
  - The thorax without longitudinal stripes... [13](#)
- 8([7](#)).
  - The eyes hairy ... [9](#)
  - The eyes bare... [10](#)
- 9([8](#)).
  - The face ground-coloured at least part yellow; the lower outer marginal vein more or less parallel with the posterior wing margin; wings divergent in repose; the larvae not translucent ... **Scaeva**
  - The face entirely dark in ground colour; the lower outer marginal vein markedly diverging from the posterior wing margin; wings incumbent and almost parallel in repose; the larvae translucent ... **Melanostoma**
- 10([8](#)).
  - The upper and lower outer marginal cross veins more or less continuous ... **Epistrophe**
  - The upper and lower outer marginal cross veins slightly stepped... [11](#)
  - The upper and lower outer marginal cross veins strongly stepped... [12](#)

- 11(10). • The face ground-coloured at least part yellow; the thorax patterned; the larvae tapering anteriorly and posteriorly from the middle; the larvae not translucent ... **Sphaerophoria**  
• The face entirely dark in ground colour; the thorax plain; the larvae broader posteriorly, tapered to the head; the larvae translucent ... **Melanostoma**
- 12(10). • The lateral margins of the tergites exhibiting beaded rims; the larvae not green ... **Xanthogramma**  
• The lateral margins of the tergites smoothly rolled over and without beading; the larvae green ... **Sphaerophoria**
- 13(7). • Vein R<sub>4+5</sub> with a conspicuous curve projecting into the cell R<sub>5</sub> ... [14](#)  
• Vein R<sub>4+5</sub> without a conspicuous curve projecting into the cell R<sub>5</sub>... [15](#)
- 14(13). • Antennae relatively short, drooping (shorter than the head); the antennal bristle dorsal (proximal to sub-apical); the anterior cross vein R-M in cell R<sub>5</sub> crossing it before the middle of the adjoining discal cell; vein R<sub>4+5</sub> without a backwardly projecting, incomplete transverse veinlet; the face with a central knob (median prominence or tubercle) ... **Eupeodes**  
• Antennae relatively long, porrect (at least as long as the head); the antennal bristle apical, terminating the third segment; the anterior cross vein R-M in cell R<sub>5</sub> crossing it at or beyond the middle of the adjoining discal cell; vein R<sub>4+5</sub> with a short, backwardly projecting, incomplete transverse veinlet located distally to the cross veinlet in cell R<sub>5</sub>; the face without a central knob ... **Ceriana**
- 15(13). • The face ground-coloured at least part yellow ... [16](#)  
• The face entirely dark in ground colour... [28](#)
- 16(15). • The eyes hairy ... [17](#)  
• The eyes bare... [22](#)
- 17(16). • The lower outer marginal vein markedly diverging from the posterior wing margin ... **Paragus**  
• The lower outer marginal vein slightly diverging from the posterior wing margin... [18](#)  
• The lower outer marginal vein more or less parallel with the posterior wing margin... [19](#)
- 18(17). • The dorsum of tergite 2 exhibiting a wineglass-shaped black area; the anterior anepisternum at least partly pilose; the larvae tapering anteriorly and posteriorly from the middle; the larvae laterally smooth; the anal segments of the larvae without horn-like projections ... **Parasyrphus**  
• The dorsum of tergite 2 without a wineglass-shaped black area; the anterior anepisternum bare; the larvae broader posteriorly, tapered to the head; the larvae with conspicuous lateral projections; the anal segments of the larvae with a pair of curved, horn-like projections ... **Dasyphorus**
- 19(17). • The upper outer marginal cross-vein gently curved or straightish; the thoracic squamae with long hairs on their dorsal surfaces ... **Syrphus**  
• The upper outer marginal cross-vein conspicuously bent near the base the base; the thoracic squamae without long hairs dorsally... [20](#)
- 20(19). • Wings with a conspicuous dark stigma ... **Leucozona**  
• Wings without a conspicuously dark stigma... [21](#)
- 21(20). • The abdomen wider than the thorax; wings divergent in repose; the anterior anepisternum bare; the larvae broader posteriorly, tapered to the head; the larvae scarcely flattened ... **Scaeva**  
• The abdomen about the same width as the thorax; wings incumbent and almost parallel in repose; the anterior anepisternum at least partly pilose; the larvae tapering anteriorly and

posteriorly from the middle; the larvae flattened ... **Parasyrphus**

- 22(16). • Wings exhibiting tiny uniformly spaced black flecks along the hind edges ... **Meliscaeva**  
• Wings without black flecks along the hind edges... [23](#)
- 23(22). • The thorax patterned ... **Epistrophe**  
• The thorax plain... [24](#)
- 24(23). • The thoracic squamae with long hairs on their dorsal surfaces ... **Syrphus**  
• The thoracic squamae without long hairs dorsally... [25](#)
- 25(24). • The lateral margins of the tergites exhibiting beaded rims ... [26](#)  
• The lateral margins of the tergites smoothly rolled over and without beading... [27](#)
- 26(25). • The anterior anepisternum at least partly pilose; the larvae tapering anteriorly and posteriorly from the middle; the larvae flattened ... **Parasyrphus**  
• The anterior anepisternum bare; the larvae broader posteriorly, tapered to the head; the larvae scarcely flattened ... **Eupeodes**
- 27(25). • The anterior anepisternum at least partly pilose; the larvae tapering anteriorly and posteriorly from the middle ... **Parasyrphus**  
• The anterior anepisternum bare; the larvae broader posteriorly, tapered to the head ... **Meligrama**
- 28(15). • Wings with a conspicuous dark stigma ... [29](#)  
• Wings without a conspicuously dark stigma... [30](#)
- 29(28). • The alula distinct; the abdomen wider than the thorax; the abdomen not petiolated; antennae with their bases well separated; the larvae green ... **Xanthandrus**  
• The alula indistinct; the abdomen narrower than the thorax; the abdomen proximally petiolated; antennae with their bases approximated; the larvae not green ... **Baccha**
- 30(28). • The metasternum entire, broad over its whole length ... [31](#)  
• The metasternum reduced, the sclerotized part small with the central area diamond-shaped ... **Melanostoma**
- 31(30). • The lower outer marginal vein markedly diverging from the posterior wing margin ... **Platycheirus**  
• The lower outer marginal vein slightly diverging from the posterior wing margin ... **Platycheirus**  
• The lower outer marginal vein more or less parallel with the posterior wing margin ... **Melangyna**
- 32(2). • Antennae relatively short, drooping (shorter than the head) ... [33](#)  
• Antennae relatively long, porrect (at least as long as the head)... [61](#)
- 33(32). • The thorax with longitudinal stripes ... [34](#)  
• The thorax without longitudinal stripes... [39](#)
- 34(33). • The eyes hairy ... **Scaeva**  
• The eyes bare... [35](#)
- 35(34). • The thorax patterned; wings without black flecks along the hind edges; the anterior anepisternum bare; the larvae not translucent ... [36](#)  
• The thorax plain; wings exhibiting tiny uniformly spaced black flecks along the hind edges; the anterior anepisternum at least partly pilose; the larvae translucent ... **Episyrphus**
- 36(35). • The upper and lower outer marginal cross veins more or less continuous ... **Epistrophe**

- The upper and lower outer marginal cross veins slightly stepped ... **Sphaerophoria**
- The upper and lower outer marginal cross veins strongly stepped... [37](#)

37([36](#)).   

- The lateral margins of the tergites exhibiting beaded rims ... **Xanthogramma**
- The lateral margins of the tergites smoothly rolled over and without beading... [38](#)

38([37](#)).   

- Wings patterned; the larvae not green ... **Doros**
- Wings plain; the larvae green ... **Sphaerophoria**

39([33](#)).   

- Vein R<sub>4+5</sub> with a conspicuous curve projecting into the cell R<sub>5</sub> ... [40](#)
- Vein R<sub>4+5</sub> without a conspicuous curve projecting into the cell R<sub>5</sub>... [43](#)

40([39](#)).   

- Wings with a conspicuous dark stigma ... [41](#)
- Wings without a conspicuously dark stigma... [42](#)

41([40](#)).   

- The scutellum at least partly yellow ... **Didea**
- The scutellum brownish, ferruginous or tawny ... **Didea**
- The scutellum whitish ... **Eriozona**

42([40](#)).   

- The scutellum aeneous ... **Eupeodes**
- The scutellum brownish, ferruginous or tawny ... **Eupeodes**
- The scutellum black ... **Eupeodes**
- The scutellum whitish ... **Eriozona**

43([39](#)).   

- The face ground-coloured at least part yellow ... [44](#)
- The face entirely dark in ground colour... [58](#)

44([43](#)).   

- The eyes hairy ... [45](#)
- The eyes bare... [51](#)

45([44](#)).   

- The upper outer marginal cross-vein gently curved or straightish; the thoracic squamae with long hairs on their dorsal surfaces ... **Syrphus**
- The upper outer marginal cross-vein conspicuously bent near the base the base; the thoracic squamae without long hairs dorsally... [46](#)

46([45](#)).   

- Wings with a conspicuous dark stigma ... [47](#)
- Wings without a conspicuously dark stigma... [48](#)

47([46](#)).   

- The lower outer marginal vein slightly diverging from the posterior wing margin; the lateral margins of the tergites exhibiting beaded rims; the larvae not translucent; the larvae with conspicuous lateral projections; the anal segments of the larvae with a pair of curved, horn-like projections ... **Dasyphorus**
- The lower outer marginal vein more or less parallel with the posterior wing margin; the lateral margins of the tergites smoothly rolled over and without beading; the larvae translucent; the larvae laterally smooth; the anal segments of the larvae without horn-like projections ... **Leucozona**

48([46](#)).   

- The lower outer marginal vein slightly diverging from the posterior wing margin ... [49](#)
- The lower outer marginal vein more or less parallel with the posterior wing margin... [50](#)

49([48](#)).   

- The dorsum of tergite 2 exhibiting a wineglass-shaped black area; the anterior anepisternum at least partly pilose; the larvae tapering anteriorly and posteriorly from the middle; the larvae laterally smooth; the anal segments of the larvae without horn-like projections ... **Parasyphus**
- The dorsum of tergite 2 without a wineglass-shaped black area; the anterior anepisternum bare; the larvae broader posteriorly, tapered to the head; the larvae with conspicuous lateral projections; the anal segments of the larvae with a pair of curved, horn-like projections ... **Dasyphorus**

- 50(48). • The abdomen wider than the thorax; wings divergent in repose; the anterior anepisternum bare; the larvae broader posteriorly, tapered to the head; the larvae scarcely flattened ... **Scaeava**
- The abdomen about the same width as the thorax; wings incumbent and almost parallel in repose; the anterior anepisternum at least partly pilose; the larvae tapering anteriorly and posteriorly from the middle; the larvae flattened ... **Parasyrphus**
- 51(44). • Wings exhibiting tiny uniformly spaced black flecks along the hind edges ... [52](#)
- Wings without black flecks along the hind edges... [53](#)
- 52(51). • The scutellum at least partly yellow; the lower outer marginal vein slightly diverging from the posterior wing margin; wings incumbent and almost parallel in repose; the flies sphecid wasp-like; the larvae not green ... **Meliscaeva**
- The scutellum brownish, ferruginous or tawny; the lower outer marginal vein more or less parallel with the posterior wing margin; wings divergent in repose; the flies *Nomada*-like; the larvae green ... **Episyphus**
- 53(51). • The thorax patterned ... **Epistrophe**
- The thorax plain... [54](#)
- 54(53). • The upper outer marginal cross-vein gently curved or straightish; the thoracic squamae with long hairs on their dorsal surfaces ... **Syrphus**
- The upper outer marginal cross-vein conspicuously bent near the base the base; the thoracic squamae without long hairs dorsally... [55](#)
- 55(54). • The dorsum of tergite 2 exhibiting a wineglass-shaped black area ... [56](#)
- The dorsum of tergite 2 without a wineglass-shaped black area... [57](#)
- 56(55). • The anterior anepisternum at least partly pilose; the larvae tapering anteriorly and posteriorly from the middle; the larvae flattened ... **Parasyrphus**
- The anterior anepisternum bare; the larvae broader posteriorly, tapered to the head; the larvae scarcely flattened ... **Eupeodes**
- 57(55). • The scutellum aeneous ... **Eupeodes**
- The scutellum brownish, ferruginous or tawny ... **Eupeodes**
- The scutellum black ... **Eupeodes**
- The scutellum whitish ... **Eriozona**
- 58(43). • Wings with a conspicuous dark stigma ... [59](#)
- Wings without a conspicuously dark stigma... [60](#)
- 59(58). • The alula distinct; the abdomen wider than the thorax; the abdomen not petiolated; antennae with their bases well separated; the larvae green ... **Xanthandrus**
- The alula indistinct; the abdomen narrower than the thorax; the abdomen proximally petiolated; antennae with their bases approximated; the larvae not green ... **Baccha**
- 60(58). • The lower outer marginal vein markedly diverging from the posterior wing margin ... **Platycheirus**
- The lower outer marginal vein slightly diverging from the posterior wing margin ... **Platycheirus**
- The lower outer marginal vein more or less parallel with the posterior wing margin ... **Melangyna**
- 61(32). • The thorax with longitudinal stripes; the antennal bristle dorsal (proximal to sub-apical); the anterior cross vein R-M in cell R5 crossing it before the middle of the adjoining discal cell; vein R4+5 without a backwardly projecting, incomplete transverse veinlet; wings incumbent and almost parallel in repose ... **Chrysotoxum**
- The thorax without longitudinal stripes; the antennal bristle apical, terminating the third

segment; the anterior cross vein R-M in cell R5 crossing it at or beyond the middle of the adjoining discal cell; vein R4+5 with a short, backwardly projecting, incomplete transverse veinlet located distally to the cross veinlet in cell R5; wings divergent in repose ... **Ceriana**

- 62([2](#)). • The thorax with longitudinal stripes; the head about the same width as the thorax; the thorax patterned; wings patterned; the lateral margins of the tergites smoothly rolled over and without beading ... **Doros**
- The thorax without longitudinal stripes; the head wider than the thorax; the thorax plain; wings plain; the lateral margins of the tergites exhibiting beaded rims ... **Eriozona**
- 63([1](#)). • Vein R4+5 with a conspicuous curve projecting into the cell R5 ... [64](#)
- Vein R4+5 without a conspicuous curve projecting into the cell R5... [83](#)
- 64([63](#)). • The flies 5-10 mm long ... [65](#)
- The flies 10-15 mm long... [71](#)
- The flies 15-20 mm long... [81](#)
- 65([64](#)). • The eyes hairy ... [66](#)
- The eyes bare... [69](#)
- 66([65](#)). • Antennae relatively short, drooping (shorter than the head); the antennal bristle dorsal (proximal to sub-apical); vein R4+5 without a backwardly projecting, incomplete transverse veinlet; the lower outer marginal vein more or less parallel with the posterior wing margin ... [67](#)
- Antennae relatively long, porrect (at least as long as the head); the antennal bristle apical, terminating the third segment; vein R4+5 with a short, backwardly projecting, incomplete transverse veinlet located distally to the cross veinlet in cell R5; the lower outer marginal vein slightly diverging from the posterior wing margin ... **Ceriana**
- 67([66](#)). • The thorax black with pale longitudinal and transverse markings which produce a skull-like figure ... **Myathropa**
- The thorax not exhibiting a skull-like figure... [68](#)
- 68([67](#)). • The hind femur with a large triangular plate at its distal end; the thorax shaggy with soft hair; wings incumbent and almost parallel in repose; the larvae posteriorly blunt and tail-less; the anal segment of the larva shorter than the rest of the body ... **Merodon**
- The hind femur distally with neither a triangular plate nor a tooth; the thorax pubescent without stiff bristles interspersed (not shaggy); wings divergent in repose; the larvae tailed; the anal segment of the larva at least as long as the rest of the body ... **Eristalinus**
- 69([65](#)). • Antennae relatively short, drooping (shorter than the head); the antennal bristle dorsal (proximal to sub-apical); vein R4+5 without a backwardly projecting, incomplete transverse veinlet; the lower outer marginal vein more or less parallel with the posterior wing margin; the scutellum brownish, ferruginous or tawny ... [70](#)
- Antennae relatively long, porrect (at least as long as the head); the antennal bristle apical, terminating the third segment; vein R4+5 with a short, backwardly projecting, incomplete transverse veinlet located distally to the cross veinlet in cell R5; the lower outer marginal vein slightly diverging from the posterior wing margin; the scutellum at least partly yellow ... **Ceriana**
- 70([69](#)). • The thorax black with pale longitudinal and transverse markings which produce a skull-like figure; the tergite bands much less wide than the segments; wings divergent in repose ... **Anasimyia**
- The thorax not exhibiting a skull-like figure; the tergite bands almost as wide as the segments; wings incumbent and almost parallel in repose ... **Parhelophilus**

- 71(64). • The eyes hairy ... [72](#)  
• The eyes bare... [77](#)
- 72(71). • Antennae relatively short, drooping (shorter than the head); the antennal bristle dorsal (proximal to sub-apical); vein R4+5 without a backwardly projecting, incomplete transverse veinlet; the lower outer marginal vein more or less parallel with the posterior wing margin ... [73](#)  
• Antennae relatively long, porrect (at least as long as the head); the antennal bristle apical, terminating the third segment; vein R4+5 with a short, backwardly projecting, incomplete transverse veinlet located distally to the cross veinlet in cell R5; the lower outer marginal vein slightly diverging from the posterior wing margin ... **Ceriana**
- 73([72](#)). • The abdomen conspicuously furry ... [74](#)  
• The abdomen not conspicuously furry (short-haired to more or less hairless)... [75](#)
- 74([73](#)). • Wing veins R2+3 and R4+5 forming a closed cell; the upper outer marginal cross-vein not re-entrant; the hind femur distally with neither a triangular plate nor a tooth; the thorax pubescent without stiff bristles interspersed (not shaggy); the larvae tailed ... **Eristalis**  
• Wing veins R2+3 and R4+5 not forming a closed cell, but ending separately at the margin; the upper outer marginal cross-vein re-entrant; the hind femur with a large triangular plate at its distal end; the thorax shaggy with soft hair; the larvae posteriorly blunt and tail-less ... **Merodon**
- 75([73](#)). • The thorax black with pale longitudinal and transverse markings which produce a skull-like figure ... **Myathropa**  
• The thorax not exhibiting a skull-like figure... [76](#)
- 76([75](#)). • The hind femur with a large triangular plate at its distal end; the thorax shaggy with soft hair; wings incumbent and almost parallel in repose; the larvae posteriorly blunt and tail-less; the anal segment of the larva shorter than the rest of the body ... **Merodon**  
• The hind femur distally with neither a triangular plate nor a tooth; the thorax pubescent without stiff bristles interspersed (not shaggy); wings divergent in repose; the larvae tailed; the anal segment of the larva at least as long as the rest of the body ... **Eristalinus**
- 77([71](#)). • The tergite patterning comprising pale, straight, obliquely longitudinal markings on either side ... **Lejops**  
• The tergite patterning not comprising obliquely longitudinal marks... [78](#)
- 78([77](#)). • Antennae relatively short, drooping (shorter than the head); the antennal bristle dorsal (proximal to sub-apical); the scutellum brownish, ferruginous or tawny; vein R4+5 without a backwardly projecting, incomplete transverse veinlet; the lower outer marginal vein more or less parallel with the posterior wing margin ... [79](#)  
• Antennae relatively long, porrect (at least as long as the head); the antennal bristle apical, terminating the third segment; the scutellum at least partly yellow; vein R4+5 with a short, backwardly projecting, incomplete transverse veinlet located distally to the cross veinlet in cell R5; the lower outer marginal vein slightly diverging from the posterior wing margin ... **Ceriana**
- 79([78](#)). • The thorax black with pale longitudinal and transverse markings which produce a skull-like figure; the tergite bands much less wide than the segments ... **Anasimyia**  
• The thorax not exhibiting a skull-like figure; the tergite bands almost as wide as the segments... [80](#)
- 80([79](#)). • Wings with a conspicuous dark stigma ... **Parhelophilus**  
• Wings without a conspicuously dark stigma ... **Helophilus**
- 81([64](#)). • The eyes hairy; the abdomen conspicuously furry; wing veins R2+3 and R4+5 forming a

closed cell ... **Eristalis**

- The eyes bare; the abdomen not conspicuously furred (short-haired to more or less hairless); wing veins R<sub>2+3</sub> and R<sub>4+5</sub> not forming a closed cell, but ending separately at the margin... [82](#)

82([81](#)). • The thorax with longitudinal stripes; the abdomen contrastingly patterned; the thorax patterned; the flies vespid wasp-like ... **Helophilus**

- The thorax without longitudinal stripes; the abdomen not contrastingly patterned; the thorax plain; the flies hivebee-like ... **Mallota**

83([63](#)). • The flies 2-5 mm long ... [84](#)  
• The flies 5-10 mm long... [100](#)  
• The flies 10-15 mm long... [149](#)  
• The flies 15-20 mm long... [172](#)

84([83](#)). • The anterior cross vein R-M in cell R<sub>5</sub> crossing it before the middle of the adjoining discal cell ... [85](#)  
• The anterior cross vein R-M in cell R<sub>5</sub> crossing it at or beyond the middle of the adjoining discal cell... [99](#)

85([84](#)). • The abdomen contrastingly patterned ... [86](#)  
• The abdomen not contrastingly patterned... [90](#)

86([85](#)). • The tergite patterning confined to tergite 2; the upper outer marginal cross-vein conspicuously bent near the base the base; the larvae translucent ... **Trichopsomyia**  
• The tergite patterning not confined to one tergite; the upper outer marginal cross-vein conspicuously bent well above the base; the larvae not translucent... [87](#)

87([86](#)). • The third (bistle-bearing) antennal segment ovoid or orbicular ... [88](#)  
• The third (bistle-bearing) antennal segment almost semicircular, with the upper edge straight and the arista near the apex ... **Pelecocera**

88([87](#)). • The tergite bands much less wide than the segments ... **Neoascia**  
• The tergite bands almost as wide as the segments... [89](#)

89([88](#)). • The abdomen proximally petiolated; wings incumbent and almost parallel in repose ... **Sphegina**  
• The abdomen not petiolated; wings divergent in repose ... **Chamaesyrphus**

90([85](#)). • The antennal bristle apical, terminating the third segment; the antennal bristle plumose; the larvae with conspicuous lateral projections ... **Hammerschmidtia**  
• The antennal bristle dorsal (proximal to sub-apical); the antennal bristle simple (bare, or no more than shortly hairy); the larvae laterally smooth... [91](#)

91([90](#)). • The eyes hairy ... [92](#)  
• The eyes bare... [95](#)

92([91](#)). • Wings with a conspicuous dark stigma; the larvae tailed; the larvae saprophagous; the larvae aquatic ... **Orthonevra**  
• Wings without a conspicuously dark stigma; the larvae posteriorly blunt and tail-less; the larvae predatory; the larvae non-aquatic... [93](#)

93([92](#)). • The abdomen dominated by the large tergites 2 and 3, tergite 4 being minute or not visible ... **Triglyphus**  
• The abdomen with tergites 2, 3 and 4 all more or less well developed and equal in length... [94](#)

94([93](#)). • The upper outer marginal cross-vein strongly angled to vein R<sub>4+5</sub>, so that cell R<sub>5</sub> is

markedly extended towards the wing tip; the larvae not translucent ... **Heringia**

- The upper outer marginal cross-vein joining vein R4+5 almost at right angles, so that cell R5 is not extended towards the wing tip; the larvae translucent ... **Trichopsomyia**

- 95([91](#)). • The upper outer marginal cross-vein conspicuously bent near the base the base ... [96](#)  
• The upper outer marginal cross-vein conspicuously bent well above the base... [98](#)

- 96([95](#)). • The abdomen dominated by the large tergites 2 and 3, tergite 4 being minute or not visible; the larvae posteriorly blunt and tail-less; the larvae flattened; the larvae non-aquatic ... **Triglyphus**  
• The abdomen with tergites 2, 3 and 4 all more or less well developed and equal in length; the larvae tailed; the larvae scarcely flattened; the larvae aquatic... [97](#)

- 97([96](#)). • Tergites 2-4 equally shiny-metallic all over, without dull patches; the face without tubercles; the frons not inflated; wings divergent in repose ... **Lejogaster**  
• Tergites 2-4 dulled at least dorsally; the face with tubercles; the frons markedly inflated; wings incumbent and almost parallel in repose ... **Melanogaster**

- 98([95](#)). • Wings with a conspicuous dark stigma; the abdomen not petiolated; the upper outer marginal cross-vein bent at a sharp angle; the larvae scarcely flattened; the larvae aquatic ... **Orthonevra**  
• Wings without a conspicuously dark stigma; the abdomen proximally petiolated; the upper outer marginal cross-vein curved on the bend; the larvae flattened; the larvae non-aquatic ... **Sphegina**

- 99([84](#)). • The lower outer marginal vein markedly diverging from the posterior wing margin; the upper outer marginal cross-vein re-entrant; the face neither keeled nor impressed; the larvae tapering anteriorly and posteriorly from the middle; the larvae posteriorly blunt and tail-less ... **Eumerus**  
• The lower outer marginal vein more or less parallel with the posterior wing margin; the upper outer marginal cross-vein not re-entrant; the face impressed; the larvae tapering posteriorly; the larvae tailed ... **Brachypalpus**

- 100([83](#)). • The anterior cross vein R-M in cell R5 crossing it before the middle of the adjoining discal cell ... [101](#)  
• The anterior cross vein R-M in cell R5 crossing it at or beyond the middle of the adjoining discal cell... [139](#)

- 101([100](#)). • Wings with a vena spuria ... [102](#)  
• Wings apparently without a vena spuria... [138](#)

- 102([101](#)). • Antennae relatively short, drooping (shorter than the head) ... [103](#)  
• Antennae relatively long, porrect (at least as long as the head)... [137](#)

- 103([102](#)). • The abdomen contrastingly patterned ... [104](#)  
• The abdomen not contrastingly patterned... [114](#)

- 104([103](#)). • The upper outer marginal cross-vein gently curved or straightish ... [105](#)  
• The upper outer marginal cross-vein conspicuously bent near the base the base... [107](#)  
• The upper outer marginal cross-vein conspicuously bent well above the base... [111](#)

- 105([104](#)). • The thorax with longitudinal stripes; the thorax patterned; the face flat or concave in the region between the antennae and the mouth ... **Syritta**  
• The thorax without longitudinal stripes; the thorax plain; the face not flat or retreating between antennae and mouth (with a central knob, or arched, or produced cone-like elsewhere than at the upper mouth edge)... [106](#)

- 106([105](#)). • The eyes rimmed along their facial borders for much of the height of the face; wings

incumbent and almost parallel in repose; the larvae posteriorly blunt and tail-less; the larvae flattened ... **Cheilosia**

- The eyes not rimmed along their facial borders for much of the height of the face; wings divergent in repose; the larvae tailed; the larvae scarcely flattened ... **Myolepta**

107([104](#)).

- The tergite patterning confined to tergite 2; the eyes not rimmed along their facial borders for much of the height of the face; the mouth with a triangular sclerite on either side; the anal segments of the larvae without lappets ... [108](#)
- The tergite patterning not confined to one tergite; the eyes rimmed along their facial borders for much of the height of the face; the mouth without triangular sclerites; the anal segments of the larvae with lappets... [109](#)

108([107](#)).

- The upper outer marginal cross-vein strongly angled to vein R<sub>4+5</sub>, so that cell R<sub>5</sub> is markedly extended towards the wing tip; wings incumbent and almost parallel in repose; the larvae not translucent ... **Pipiza**
- The upper outer marginal cross-vein joining vein R<sub>4+5</sub> almost at right angles, so that cell R<sub>5</sub> is not extended towards the wing tip; wings divergent in repose; the larvae translucent ... **Trichopsomyia**

109([107](#)).

- The face drawn out into a horizontal cone as long as the rest of the head; antennae with their bases approximated ... **Rhingia**
- The face not elongated horizontally into a cone as long as the rest of the head; antennae with their bases well separated... [110](#)

110([109](#)).

- The face with a central knob (median prominence or tubercle) ... **Cheilosia**
- The face without a central knob ... **Portevinia**

111([104](#)).

- The third (bistle-bearing) antennal segment ovoid or orbicular ... [112](#)
- The third (bistle-bearing) antennal segment almost semicircular, with the upper edge straight and the arista near the apex ... **Pelecocera**

112([111](#)).

- The tergite bands much less wide than the segments ... **Neoascia**
- The tergite bands almost as wide as the segments... [113](#)

113([112](#)).

- The abdomen proximally petiolated; wings incumbent and almost parallel in repose ... **Sphegina**
- The abdomen not petiolated; wings divergent in repose ... **Chamaesyrphus**

114([103](#)).

- The eyes hairy ... [115](#)
- The eyes bare... [124](#)

115([114](#)).

- The thorax with longitudinal stripes ... [116](#)
- The thorax without longitudinal stripes... [117](#)

116([115](#)).

- The eyes rimmed along their facial borders for much of the height of the face; wings without a conspicuously dark stigma; the upper and lower outer marginal cross veins slightly stepped; the upper outer marginal cross-vein conspicuously bent near the base the base; antennae with their bases approximated ... **Ferdinandea**
- The eyes not rimmed along their facial borders for much of the height of the face; wings with a conspicuous dark stigma; the upper and lower outer marginal cross veins strongly stepped; the upper outer marginal cross-vein conspicuously bent well above the base; antennae with their bases well separated ... **Orthonevra**

117([115](#)).

- The abdomen dominated by the large tergites 2 and 3, tergite 4 being minute or not visible ... **Triglyphus**
- The abdomen with tergites 2, 3 and 4 all more or less well developed and equal in length... [118](#)

- 118([117](#)). • The face with a central knob (median prominence or tubercle); the eyes rimmed along their facial borders for much of the height of the face ... **Cheilosia**  
• The face without a central knob; the eyes not rimmed along their facial borders for much of the height of the face... [119](#)
- 119([118](#)). • The upper outer marginal cross-vein strongly angled to vein R<sub>4+5</sub>, so that cell R<sub>5</sub> is markedly extended towards the wing tip ... [120](#)  
• The upper outer marginal cross-vein joining vein R<sub>4+5</sub> almost at right angles, so that cell R<sub>5</sub> is not extended towards the wing tip... [122](#)
- 120([119](#)). • The upper outer marginal cross-vein gently curved or straightish ... **Heringia**  
• The upper outer marginal cross-vein conspicuously bent near the base the base... [121](#)  
• The upper outer marginal cross-vein conspicuously bent well above the base ... **Orthonevra**
- 121([120](#)). • The hypopleuron exhibiting long hairs on its upper transverse ridge ... **Heringia**  
• The hypopleuron with no long hairs on its upper transverse ridge ... **Pipiza**
- 122([119](#)). • Wings with a conspicuous dark stigma; the larvae tailed; the mouth without triangular sclerites; the anal segments of the larvae with lappets; the larvae aquatic ... **Orthonevra**  
• Wings without a conspicuously dark stigma; the larvae posteriorly blunt and tail-less; the mouth with a triangular sclerite on either side; the anal segments of the larvae without lappets; the larvae non-aquatic... [123](#)
- 123([122](#)). • Wings divergent in repose; the larvae translucent; the larvae plain ... **Trichopsomyia**  
• Wings incumbent and almost parallel in repose; the larvae not translucent; the larvae patterned ... **Pipizella**
- 124([114](#)). • The antennal bristle apical, terminating the third segment; the antennal bristle plumose ... **Hammerschmidtia**  
• The antennal bristle dorsal (proximal to sub-apical); the antennal bristle simple (bare, or no more than shortly hairy)... [125](#)
- 125([124](#)). • The face drawn out into a horizontal cone as long as the rest of the head ... **Rhingia**  
• The face not elongated horizontally into a cone as long as the rest of the head... [126](#)
- 126([125](#)). • The upper outer marginal cross-vein gently curved or straightish ... **Cheilosia**  
• The upper outer marginal cross-vein conspicuously bent near the base the base... [127](#)  
• The upper outer marginal cross-vein conspicuously bent well above the base... [133](#)
- 127([126](#)). • The abdomen dominated by the large tergites 2 and 3, tergite 4 being minute or not visible ... **Triglyphus**  
• The abdomen with tergites 2, 3 and 4 all more or less well developed and equal in length... [128](#)
- 128([127](#)). • Tergites 2-4 equally shiny-metallic all over, without dull patches ... [129](#)  
• Tergites 2-4 dulled at least dorsally... [130](#)
- 129([128](#)). • The face with a central knob (median prominence or tubercle); the eyes rimmed along their facial borders for much of the height of the face; wings incumbent and almost parallel in repose; the face not flat or retreating between antennae and mouth (with a central knob, or arched, or produced cone-like elsewhere than at the upper mouth edge); the larvae posteriorly blunt and tail-less ... **Cheilosia**  
• The face without a central knob; the eyes not rimmed along their facial borders for much of the height of the face; wings divergent in repose; the face flat or concave in the region between the antennae and the mouth; the larvae tailed ... **Lejogaster**
- 130([128](#)). • The frons markedly inflated ... [131](#)

- The frons not inflated... [132](#)

- 131([130](#)). • Antennae black; wings incumbent and almost parallel in repose; the face flat or concave in the region between the antennae and the mouth ... **Melanogaster**
- Antennae ferruginous; wings divergent in repose; the face not flat or retreating between antennae and mouth (with a central knob, or arched, or produced cone-like elsewhere than at the upper mouth edge) ... **Chrysogaster**

- 132([130](#)). • The abdomen oval ... **Riponnensia**
- The abdomen ovate (distally broadened) ... **Riponnensia**
  - The abdomen oblong ... **Chrysogaster**
  - The abdomen obovate (distally narrowed) ... **Chrysogaster**

- 133([126](#)). • The upper outer marginal cross-vein bent at a sharp angle; the abdomen not petiolated ... [134](#)
- The upper outer marginal cross-vein curved on the bend; the abdomen proximally petiolated ... **Sphegina**

- 134([133](#)). • Wings with a conspicuous dark stigma ... [135](#)
- Wings without a conspicuously dark stigma... [136](#)

- 135([134](#)). • The abdomen oval ... **Orthonevra**
- The abdomen ovate (distally broadened) ... **Orthonevra**
  - The abdomen oblong ... **Orthonevra**
  - The abdomen obovate (distally narrowed) ... **Brachyopa**

- 136([134](#)). • The abdomen oval ... **Riponnensia**
- The abdomen ovate (distally broadened) ... **Riponnensia**
  - The abdomen obovate (distally narrowed) ... **Brachyopa**

- 137([102](#)). • The eyes hairy; the antennal bristle apical, terminating the third segment; the head wider than the thorax; vein R4+5 without a backwardly projecting, incomplete transverse veinlet; the upper outer marginal cross-vein not re-entrant ... **Callicera**
- The eyes bare; the antennal bristle dorsal (proximal to sub-apical); the head about the same width as the thorax; vein R4+5 with a short, backwardly projecting, incomplete transverse veinlet located distally to the cross veinlet in cell R5; the upper outer marginal cross-vein re-entrant ... **Microdon**

- 138([101](#)). • The eyes hairy; the upper outer marginal cross-vein conspicuously bent well above the base; antennae black; antennae with their bases approximated; the face flat or concave in the region between the antennae and the mouth ... **Psilotia**
- The eyes bare; the upper outer marginal cross-vein conspicuously bent near the base the base; antennae ferruginous; antennae with their bases well separated; the face not flat or retreating between antennae and mouth (with a central knob, or arched, or produced cone-like elsewhere than at the upper mouth edge) ... **Chrysogaster**

- 139([100](#)). • The abdomen contrastingly patterned ... [140](#)
- The abdomen not contrastingly patterned... [145](#)

- 140([139](#)). • The abdomen conspicuously furry ... **Blera**
- The abdomen not conspicuously furry (short-haired to more or less hairless)... [141](#)

- 141([140](#)). • The upper outer marginal cross-vein gently curved or straightish ... [142](#)
- The upper outer marginal cross-vein conspicuously bent near the base the base... [143](#)
  - The upper outer marginal cross-vein conspicuously bent well above the base ... **Eumerus**

- 142([141](#)). • The thorax with longitudinal stripes; the thorax patterned; the lower outer marginal vein

markedly diverging from the posterior wing margin; the upper and lower outer marginal cross veins strongly stepped; the abdomen narrower than the thorax ... **Syritta**

- The thorax without longitudinal stripes; the thorax plain; the lower outer marginal vein more or less parallel with the posterior wing margin; the upper and lower outer marginal cross veins more or less continuous; the abdomen about the same width as the thorax ... **Tropidia**

143([141](#)).

- The upper outer marginal cross-vein re-entrant; the face neither keeled nor impressed ... **Eumerus**
- The upper outer marginal cross-vein not re-entrant; the face impressed... [144](#)

144([143](#)).

- The abdomen about 4 to 5.7; the larvae flattened; the larvae with hooks on the thorax ... **Chalcosyrphus**
- The abdomen about 5.8 to 7.8; the larvae scarcely flattened; the larvae without thoracic hooks ... **Xylota**

145([139](#)).

- The eyes hairy ... [146](#)
- The eyes bare... [147](#)

146([145](#)).

- The thorax with longitudinal stripes; the thorax patterned; the eyes rimmed along their facial borders for much of the height of the face; the thorax pubescent with stiff bristles interspersed; the larvae broader posteriorly, tapered to the head ... **Ferdinandea**
- The thorax without longitudinal stripes; the thorax plain; the eyes not rimmed along their facial borders for much of the height of the face; the thorax shaggy with soft hair; the larvae tapering posteriorly ... **Brachypalpus**

147([145](#)).

- The upper outer marginal cross-vein re-entrant; the larvae tapering anteriorly and posteriorly from the middle; the larvae posteriorly blunt and tail-less; the larvae phytophagous ... **Eumerus**
- The upper outer marginal cross-vein not re-entrant; the larvae tapering posteriorly; the larvae tailed; the larvae saprophagous... [148](#)

148([147](#)).

- The scutellum somewhat convex, with undefined edge; the lower outer marginal vein more or less parallel with the posterior wing margin; antennae with their bases approximated; the thorax shaggy with soft hair; the larvae flattened ... **Brachypalpus**
- The scutellum flat, with a well defined edge; the lower outer marginal vein markedly diverging from the posterior wing margin; antennae with their bases well separated; the thorax pubescent without stiff bristles interspersed (not shaggy); the larvae scarcely flattened ... **Riponnensis**

149([83](#)).

- The antennal bristle simple (bare, or no more than shortly hairy) ... [150](#)
- The antennal bristle plumose... [169](#)

150([149](#)).

- The anterior cross vein R-M in cell R5 crossing it before the middle of the adjoining discal cell ... [151](#)
- The anterior cross vein R-M in cell R5 crossing it at or beyond the middle of the adjoining discal cell... [157](#)

151([150](#)).

- Antennae relatively short, drooping (shorter than the head) ... [152](#)
- Antennae relatively long, porrect (at least as long as the head)... [156](#)

152([151](#)).

- The thorax with longitudinal stripes; the thorax patterned ... **Ferdinandea**
- The thorax without longitudinal stripes; the thorax plain... [153](#)

153([152](#)).

- The eyes rimmed along their facial borders for much of the height of the face ... **Cheilosia**
- The eyes not rimmed along their facial borders for much of the height of the face... [154](#)

- 154([153](#)). • The upper outer marginal cross-vein gently curved or straightish; the face not flat or retreating between antennae and mouth (with a central knob, or arched, or produced cone-like elsewhere than at the upper mouth edge); wings divergent in repose ... **Myolepta**
- The upper outer marginal cross-vein conspicuously bent near the base the base; the face flat or concave in the region between the antennae and the mouth; wings incumbent and almost parallel in repose... [155](#)
- 155([154](#)). • The lower outer marginal vein markedly diverging from the posterior wing margin; the larvae posteriorly blunt and tail-less; the mouth with a triangular sclerite on either side; the anal segments of the larvae without lappets; the larvae predatory ... **Pipiza**
- The lower outer marginal vein more or less parallel with the posterior wing margin; the larvae tailed; the mouth without triangular sclerites; the anal segments of the larvae with lappets; the larvae saprophagous ... **Brachypalpoides**
- 156([151](#)). • The eyes hairy; the antennal bristle apical, terminating the third segment; the head wider than the thorax; vein R<sub>4+5</sub> without a backwardly projecting, incomplete transverse veinlet; the upper outer marginal cross-vein not re-entrant ... **Callicera**
- The eyes bare; the antennal bristle dorsal (proximal to sub-apical); the head about the same width as the thorax; vein R<sub>4+5</sub> with a short, backwardly projecting, incomplete transverse veinlet located distally to the cross veinlet in cell R<sub>5</sub>; the upper outer marginal cross-vein re-entrant ... **Microdon**
- 157([150](#)). • The abdomen conspicuously furry ... [158](#)
- The abdomen not conspicuously furry (short-haired to more or less hairless)... [161](#)
- 158([157](#)). • The upper outer marginal cross-vein gently curved or straightish ... **Criorhina**
- The upper outer marginal cross-vein conspicuously bent near the base the base... [159](#)
- 159([158](#)). • The head wider than the thorax ... **Caliprobola**
- The head about the same width as the thorax... [160](#)
- The head less wide than the thorax ... **Pocota**
- 160([159](#)). • The scutellum somewhat convex, with undefined edge; wings divergent in repose; the larvae tapering posteriorly ... **Caliprobola**
- The scutellum flat, with a well defined edge; wings incumbent and almost parallel in repose; the larvae broader posteriorly, tapered to the head ... **Blera**
- 161([157](#)). • The abdomen contrastingly patterned ... [162](#)
- The abdomen not contrastingly patterned... [167](#)
- 162([161](#)). • The upper and lower outer marginal cross veins more or less continuous ... [163](#)
- The upper and lower outer marginal cross veins slightly stepped ... **Brachypalpoides**
- The upper and lower outer marginal cross veins strongly stepped... [164](#)
- 163([162](#)). • The upper outer marginal cross-vein gently curved or straightish; the face longitudinally keeled; the larvae tapering posteriorly; the colour-patterned tergites marked with tawny to orange-ish; the larvae in decaying vegetation ... **Tropidia**
- The upper outer marginal cross-vein conspicuously bent near the base the base; the face impressed; the larvae broader posteriorly, tapered to the head; the colour-patterned tergites marked with red; the larvae in rotten wood ... **Brachypalpoides**
- 164([162](#)). • The upper outer marginal cross-vein re-entrant ... **Eumerus**
- The upper outer marginal cross-vein not re-entrant... [165](#)
- 165([164](#)). • The scutellum somewhat convex, with undefined edge; the face ground-coloured at least part yellow ... **Caliprobola**
- The scutellum flat, with a well defined edge; the face entirely dark in ground

colour... [166](#)

- The abdomen about 4 to 5.7; the larvae flattened; the larvae with hooks on the thorax ... **Chalcosyrphus**
- The abdomen about 5.8 to 7.8; the larvae scarcely flattened; the larvae without thoracic hooks ... **Xylota**

[166\(165\)](#).

- The eyes rimmed along their facial borders for much of the height of the face ... **Ferdinandea**
- The eyes not rimmed along their facial borders for much of the height of the face... [168](#)

[167\(161\)](#).

- The lower outer marginal vein markedly diverging from the posterior wing margin; the upper outer marginal cross-vein re-entrant; the face neither keeled nor impressed; the larvae tapering anteriorly and posteriorly from the middle; the larvae posteriorly blunt and tail-less ... **Eumerus**
- The lower outer marginal vein more or less parallel with the posterior wing margin; the upper outer marginal cross-vein not re-entrant; the face impressed; the larvae tapering posteriorly; the larvae tailed ... **Brachypalpus**

[169\(149\)](#).

- The abdomen contrastingly patterned ... [170](#)
- The abdomen not contrastingly patterned... [171](#)

[170\(169\)](#).

- Wing veins R<sub>2+3</sub> and R<sub>4+5</sub> forming a closed cell; the upper outer marginal cross-vein re-entrant; antennae with their bases approximated; the larvae posteriorly blunt and tail-less; the anal segment of the larva shorter than the rest of the body ... **Volucella**
- Wing veins R<sub>2+3</sub> and R<sub>4+5</sub> not forming a closed cell, but ending separately at the margin; the upper outer marginal cross-vein not re-entrant; antennae with their bases well separated; the larvae tailed; the anal segment of the larva at least as long as the rest of the body ... **Sericomyia**

[171\(169\)](#).

- The antennal bristle apical, terminating the third segment; wings plain; the upper and lower outer marginal cross veins strongly stepped; the thorax pubescent with stiff bristles interspersed; the larvae posteriorly blunt and tail-less ... **Hammerschmidtia**
- The antennal bristle dorsal (proximal to sub-apical); wings patterned; the upper and lower outer marginal cross veins slightly stepped; the thorax shaggy with soft hair; the larvae tailed ... **Arctophila**

[172\(83\)](#).

- The antennal bristle simple (bare, or no more than shortly hairy) ... [173](#)
- The antennal bristle plumose... [177](#)

[173\(172\)](#).

- The abdomen conspicuously furry ... [174](#)
- The abdomen not conspicuously furry (short-haired to more or less hairless)... [176](#)

[174\(173\)](#).

- The upper and lower outer marginal cross veins more or less continuous; the upper outer marginal cross-vein gently curved or straightish; the larvae with hooks on the thorax ... **Criorhina**
- The upper and lower outer marginal cross veins strongly stepped; the upper outer marginal cross-vein conspicuously bent near the base the base; the larvae without thoracic hooks... [175](#)

[175\(174\)](#).

- The head wider than the thorax ... **Caliprobola**
- The head about the same width as the thorax ... **Caliprobola**
- The head less wide than the thorax ... **Pocota**

[176\(173\)](#).

- The abdomen contrastingly patterned; the thorax pubescent without stiff bristles interspersed (not shaggy); the larvae without thoracic hooks; the anal segment (segment 8) of the larva abruptly constricted basally into the long, narrow tail ... **Caliprobola**
- The abdomen not contrastingly patterned; the thorax shaggy with soft hair; the larvae

with hooks on the thorax; the anal segment (segment 8) of the larva tapered gradually to the spiracular process ... **Brachypalpus**

- 177([172](#)). • The abdomen contrastingly patterned ... [178](#)  
• The abdomen not contrastingly patterned... [179](#)
- 178([177](#)). • Wing veins R<sub>2+3</sub> and R<sub>4+5</sub> forming a closed cell; the upper outer marginal cross-vein re-entrant; antennae with their bases approximated; the larvae posteriorly blunt and tail-less; the anal segment of the larva shorter than the rest of the body ... **Volucella**  
• Wing veins R<sub>2+3</sub> and R<sub>4+5</sub> not forming a closed cell, but ending separately at the margin; the upper outer marginal cross-vein not re-entrant; antennae with their bases well separated; the larvae tailed; the anal segment of the larva at least as long as the rest of the body ... **Sericomyia**
- 179([177](#)). • The antennal bristle apical, terminating the third segment; wings plain; the upper and lower outer marginal cross veins strongly stepped; the thorax pubescent with stiff bristles interspersed; the larvae posteriorly blunt and tail-less ... **Hammerschmidtia**  
• The antennal bristle dorsal (proximal to sub-apical); wings patterned; the upper and lower outer marginal cross veins slightly stepped; the thorax shaggy with soft hair; the larvae tailed ... **Arctophila**
